- Wolferal HSS Side and Face Cutters (straight teeth) **30-31**
- Wolferal HSS Side and Face Cutters (staggered teeth) **32-33**
- Wolferal Tungsten Carbide Tipped Milling Cutters **33**
- Wolferal HSS Concave Milling Cutters **34**
- Wolferal HSS Convex Milling Cutters **35**
- Wolferal HSS Equal Angle Milling Cutters **36**
- Wolferal HSS Single Angle Milling Cutters **37**
- Wolferal T.C.T. Saw Blades **38-41**
- Premium Wolferal Throw-Away Carbide-Tipped Saw Blades for Steel **42**
- Wolferal Friction Saws **43**
- Wolferal Segmental Saws **44**
- Wolferal Xtra-Wax **45**
- Wolferal Diamond Blades **46-47**
- Premium Wolferal HSS-E Single Flute Router Cutters **48**

## The Jones Tool Co Ltd Introduction

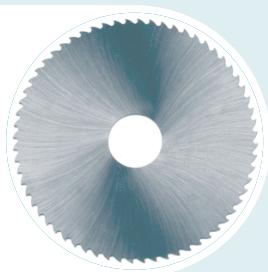

Established in 1993 as a manufacturer of tooling for the PVCu and aluminium window industries, our company has diversified over the past 10 years into a number of other strategically related market products.

More recently we have expanded yet further by acquiring the assets of Alexander S. Newall Machine Tool Co Ltd, most importantly the WOLFERAL trade name. This acquisition has substantially strengthened our position as a major supplier of saw blades and cutting tooling across a more diverse range of industries.

Our company has always endeavoured to provide customers with a combination of Quality Product, Competitive Pricing and Professional Service – this together with the availability of a wealth of technical expertise, we have achieved a loyal and ever-growing customer base.

We believe that the following pages will provide you with an insight into what our company is able to offer you and we look forward to being of service to you in the future, either as an existing customer or a new client.

**Tim Jones**  
**Managing Director**

# Characteristics of Cutting Steels and Saw Tooth Forms

**Metal cutting circular saws vary in 7 aspects:**

**Material • Design • Tooth Pitch • Tooth Form • Diameter • Thickness • Bore**

Every one of these aspects influences the performance of the tool. Choice depends on:

(A) THE MATERIAL OF THE WORKPIECE (B) THE NATURE OF THE CUT (C) MACHINE TOOL USED.

*Consideration should also be given to such ancillary conditions as lubrication, holding method, etc.*

## MATERIAL

Saws are manufactured from (a) carbon (tool) steels, (b) high speed steels, and (c) various carbides. The various combinations of available material are discussed under point 2 (Design).

Tool steels are cutting materials with iron as chief constituent. When carbon is added up to 1.7% they are referred to as carbon steels. The result of chemical combination between iron and carbon is iron carbide or cementite.

The hardness obtainable in a carbon steel tool depends on its carbon content. Up to 65 RC can be achieved with 1% carbon.

## LOWER CARBON STEELS

(0.9-1.10%) are suitable for work where toughness and high resistance to shock are of importance.

## HIGHER CARBON STEELS

(1.1-1.3%) give higher resistance to wear, and hold a keen cutting edge longer. All carbon steels fail at high temperatures, and can generally be used only for work under 205°C. However, the addition of other metals such as tungsten, molybdenum, vanadium, chromium and cobalt—with carbon content held at around 0.8%—results in steels capable of retaining their cutting properties at high temperatures. Such temperatures occurring normally with high speed work, these steels are usually referred to as High Speed Steels. Theirs is the ability to retain at elevated temperatures a high degree of hardness, known as “red hardness”.

Tungsten, Molybdenum, Vanadium and Cobalt give the tool keenness of cutting edge and stability of structure at high temperatures. Chromium is responsible for high wear resistance and toughness. Carbon is the most important element in determining the hardness of high speed steels. The breakdown point—due to temperature—of HSS varies, according to the nature of the alloy, between 482°C and 593°C. The oldest alloy in this tungsten range is known as 18-4-1, the numbers referring to percentages of tungsten, chromium and vanadium respectively.

## MOLYBDENUM HIGH SPEED STEELS

These are at least equal, and in many cases superior, to tungsten high speed steels, though their heat treatment is much more difficult. When hardened in free air, molybdenum produces a soft decarbonised skin of molybdenum oxide. This can of course be removed by grinding.

## COBALT HIGH SPEED STEELS

Cobalt additive up to 12% results in increased hardness and red hardness of the tool. It makes the tool slightly more brittle, but it can be worked at higher speeds and is especially recommended for materials which are normally difficult to machine. Maximum advantage of cobalt steels is obtained when cutting hard materials with tensile strength over 900 N/mm<sup>2</sup>.

Selected raw material specifications for WOLFERAL Precision Cutting Tools

Material	Standard No.	AISI SPEC
----------	--------------	-----------

HSS-DM05	1.3343	M2
----------	--------	----

Super high speed steel showing satisfactory toughness with normal cutting performance. Used for the manufacture of milling cutters and metal cutting circular saw blades. For cutting materials with a tensile strength up to 900 N/mm<sup>2</sup>.

EM05C05	1.3243	M35
---------	--------	-----

Heavy duty cobalt steel showing satisfactory toughness and higher heat resisting characteristics. Used for the manufacture of high output cutting tools. For machining alloyed and austenitic steels with a tensile strength up to 1200 N/mm<sup>2</sup>.

M42

1.3247

M42

Heavy duty cobalt steel with high wear resistance and notably higher heat resistant characteristics and satisfactory degree of toughness. Used for the manufacture of tools to cut high-tensile materials and austenitic steels with a tensile strength above 1200 N/mm<sup>2</sup>.

## SINTERED OR CEMENTED CARBIDES

These are a mixture of powdered tungsten carbide (sometimes with tantalum or titanium additive) with cobalt or nickel as binding material. Toughness increases with cobalt content at the expense (as in alloy steels) of hardness.

Sintered carbides are not affected by high temperatures They retain their edge at about 66 RC at temperatures surpassing 700°C. Sintered carbides used to be very expensive, and were at one time used as tips only. Their use in the solid becomes more and more accepted with the considerable reduction in price today. Cutting speeds can be increased up to twofold, with corresponding increase in tool life. But these materials remain brittle and must be used with more care.

The desirability of sintered or cemented carbides for certain operations has now been fully recognised.

The Wolferal programme consists of three qualities. The first two being our basic qualities.

**Quality K 10/K 20** with 94% WC, 6% Co, 14.9 g/cm density, 1600 hardness on HV 30 scale, 2000 N/mm<sup>2</sup> elasticity.

This combination affords through the high tungsten content a high resistance to wear and hardness of the tool. It is best applied to work on very hard steels, short chipping materials, iron materials, light metals, titanium alloys, nickel, cobalt alloys.

**Quality P 25/P 40** with 72.5% WC, 10% Co, 17.5% Tic + Tac, 12.5 g/cm density, 1450 hardness on HV 30 scale, 2200 N/mm<sup>2</sup> elasticity.

This quality gives less resistance to wear but is more tough. It is suitable for work on unalloyed steel and cast steel. It is recommended especially for work at high feeds during coarse milling, for interrupted cuts as well as for work in high temperatures.

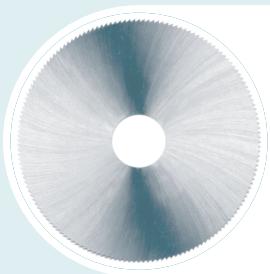

**Quality G 10 - G 60** Cobalt content between 9% and 25%.

There is an increase of elasticity with a simultaneous loss of hardness and wear resistance. "G" quality material is recommended for manufacture of knives, dies, drawing dies, punches and wear components.

As mentioned above, sintered carbide tips are generally welded on to a suitably formed base blank. Minimum width of weld base to give safe tip support is generally accepted to be about .18". With new techniques, widths of .080" or even .060" have been satisfactorily welded; but below .080" solid carbide saws are safer though more costly.

**HERE, MENTION MUST BE MADE OF CHEMICAL OR PHYSICAL DEPOSITIONS OF HARDMETAL ON CUTTING EDGES. TiN AND TiCN COATING, NITRIDING, AND CHROMIUM PLATING DO INCREASE TOOL LIFE. VARIOUS COATING SYSTEMS HAVE ALSO BEEN DEVELOPED WITH TUNGSTEN AND TANTALUM CARBIDES BUT COATED TOOLS NEED TO BE CONSIDERED ON THEIR OVERALL COST EFFECTIVENESS.**

**WE WOULD BE ONLY TOO PLEASED TO GIVE YOU THE BENEFIT OF OUR EXPERIENCE.**

## DESIGN

Basically, the following variations in design are considered sufficiently standard to form part of our normal service programme:

**Solid HSS** Hollow ground saws, with or without keyway or pin holes.

**Tipped saws** with carbide welded on to tool steel blank.

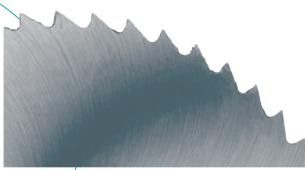

**Segmental saws** with 2 to 12 teeth segments riveted on base.

**Solid carbide saws** Made wholly from carbide, if necessary to customer's specifications or requirements.

**Circular knives** and special application saws (copper cutting, etc.).

## TOOTH FORM

The BSS dealing with saws is 122 PT. 1, 1953. It does not specify either the number or the form of tooth, limiting the specification to dimensions and tolerances of the saw and keyway. The SI standard (150 2296-1972) metric system, to which Britain declared its adherence, follows closely German DIN standards. These are 1837, 1838 and 1840 (tooth form). Wherever applicable the Wolferal blade gives the user the benefit of the Parrot or Heller tooth:-

Conventional pointed tooth

Parrot or Heller tooth

The Parrot tooth can be ground on the breast or on the top, in the former case allowing for a number of regrinds without materially reducing saw diameter. In action, the Parrot Tooth also shows considerably higher resistance to knock, and is generally used for coarse and semi-coarse pitches – very seldom in fine-pitch saws, which are usually finished with a pointed tooth.

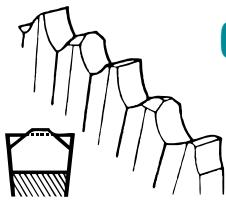

It was stated above that the Parrot tooth increases resistance to shock. Carbide and carbide-tipped cutters are frequently designed with zero or negative rake, to increase still further the tooth angle with the same aim in view. Zero and negative rakes also permit the use of much higher speeds, and can give a very much superior finish.

## SPECIFICATIONS

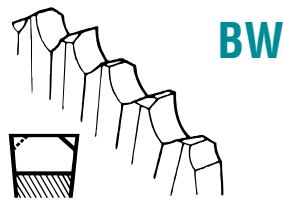

All Wolferal cutting tools are manufactured to the relevant Standard Specification (be it BSS or ISO) wherever such specifications apply. Where no approved standard exists, as in the case of Carbide and Carbide Tipped Saws, Wolferal guarantee the highest possible standard according to latest engineering practice and usage.

Where saws are intended for high production, general practice allows for side relief of alternate teeth—the HZ tooth form. The geometry of the tooth (rakes, clearances, angles, etc.) depends on the nature of the material worked. Marked differences occur between HSS, solid carbide and carbide tipped saws.

Segmental saws have their own geometry.

HZ tooth form, with alternate teeth relieved radially and on both sides axially.

All teeth relieved on alternate sides, for easier clearance with soft materials like bronze, copper and brass.

## TOOTH PITCH

It is generally acknowledged that hard materials require fine pitch saws. In HSS metal cutting saws, the standard fine pitch is accepted to be 1/8" or 8TPI (eight teeth per inch) throughout the range of diameters. Finer pitches, e.g 1/16" or 1/32", are sometimes called for. Coarse pitches vary with saw diameter.

Carbide tipped and solid carbide saws have no officially approved standard. Our price list shows the types available. In a tipped saw the number of teeth governs the price as much as performance.

## DIAMETER

Saw blanks can obviously be made in any required diameter, subject to the limitation imposed by width; there is a maximum diameter-to-width ratio which – to avoid whipping and fracture – must not be exceeded

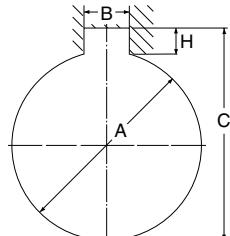

## TOLERANCES

ALL SUPER WOLFERAL SAW BLADES ARE MADE TO BE WITHIN DIN TOLERANCES. PREMIUM WOLFERAL BLADES ARE MADE TO HALF DIN TOLERANCES ON SIDE RUN-OUT AND CONCENTRICITY.

All Standard Wolferal Saws are manufactured and finished to the following tolerances, as specified in B.S. 122, Part 1. 1953:-

Saw Diameter	Saw Width	Bore Diameter
+.045"	.001"	.00075"
-.000"	-.001"	+.00025"

Closer tolerances can be quoted for on request.

## KEYWAYS

Dimensions and tolerances for the more common sizes of bore are as follows:-

A Diameter of Bore, Ins.	B Width of Keyway, Ins.	C Diameter plus Height of Keyway, Ins.	TOLERANCE	TOLERANCE
+.00075"	.007"	.015"	+.00025"	-.000"
1/2	.094	.557	%	.698
3/8	.125	.698	3/4	
1	.125	1.104	1	
1 1/8	.250	1.385	1 1/8	
	.312			

## Table of Weights for Cutting-Off Blades

## Premium Quality

### Cutting-Off Saw Blades

*We hold in stock the following steel qualities:*

- DM05 Super High-Speed Steel Slipslide-treated saw blades
- DM05 Super High-Speed Steel Slipslide-treated saw blanks
- EMo5Co5 5% Cobalt-bearing Steel Slipslide-treated saw blanks
- TiN, TiCN, TiAlN coated low run-out saw blanks

# Wolferal Premium Quality Cutting-Off Saw Blades

## STEEL QUALITIES

SHSS/DMo5 - DIN 1.3343 - JIS SKH51 - M2

High speed TUNGSTEN MOLYBDENUM STEEL.

High performance saw blades. Hardened and tempered to 64 +/- 1° HRC.

Used on all types of machines to cut tubes, pipes and solid sections made out of ferrous and non-ferrous metals with tensile strengths up to 900 N/mm<sup>2</sup> up to 160mm cross section

SUPER CX / EMo5Co5 - DIN 1.3243 - J1S SKH55 - M35

TUNGSTEN MOLYBDENUM COBALT bearing steel.

Special high performance saw blades. Hardened and tempered to 65 +/- 1° HRC.

Used mainly on Adige, Bewo and Sinico machines for cutting hard steels, titanium alloys and stainless steels with tensile strengths over 900 N/mm<sup>2</sup>.

## TOOTH FORMS FOR CUTTING-OFF SAW BLADES

**B.W.** With "BW" toothing. Alternate chamfered teeth; the chip is divided into two parts, 1/3rd and 2/3rd's of the blade width respectively. Supplied as standard on saw blades with a 3mm and 4mm tooth pitch.

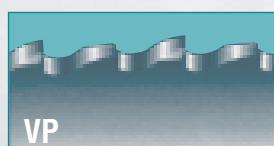

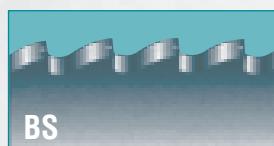

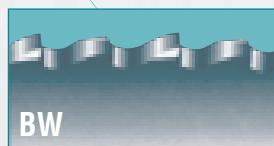

**C.** With HZ toothing, alternate "V and flat". The chip is split into three parts, each 1/3rd of the blade width. This improved swarf removal permits the use of higher cutting speeds and feeds on bigger sections and solids. Supplied as standard on saw blades with 5mm and coarser tooth pitches.

**B.S.** "CHIP BREAKER" TOOTHING. Chip breaker toothing is used mainly for cutting tubes. It gives a far significant improvement in performance and finish. Increased number of cutting edges engaged in the workpiece considerably reduces the side edge wear.

When used on coated saw blades, the number of cuts obtained can be outstanding.

We would be pleased to offer you the benefit of our many years of experience.

**V.P.** "VARIABLE PITCH" TOOTHING. Our advice on the suitability of this toothform is at your disposal.

## SURFACE TREATMENT: SLIPSLIDE – STEAM-HOMO

Unless otherwise stated, all our cutting-off blades are supplied from stock with this special treatment. A controlled oxidation process produces a layer of iron oxide ( $Fe_3O_4$ ) on the surface of a saw blade.

This increases its self-lubricating capability and greatly improves its resistance to "pick-up". Slipslide is a very low cost surface treatment suitable for most general cutting work.

**PVD** Physical Vapour Deposition COATINGS.

See *Surface Coating* Section on page 33 for further details on:

**TiN** Titanium Nitride / **TiCN** Titanium Carbo Nitride

**TiAIN** Titanium Aluminium Nitride / **CRN** Chrome Nitride.

### SLIPSLIDE

Technical characteristics  
Surface Hardness: 900 HV  
Coefficient of friction : 0.65

Ø 1"	1/7/16"/1%
Ø 1½"	2/19/32"/2½

## Why should you choose a CIRCULAR SAW?

Because:

- Better cut finishes
- Fewer burrs
- Lower cost per cut
- Higher cutting precision
- Available in a range of coatings
- THE TOOL CAN BE REGROUND MANY TIMES

## PROBLEMS AND SOLUTIONS

Problem	Possible Causes	Solutions
<b>Burrs</b>	Tooth pitch too large Worn teeth	Reduce the pitch (see p.35) Regrind the saw
<b>Build-up of chip in tooth gullet</b>	Tooth pitch too small Incorrect tooth shape Speed too high Cutting speed too high Feed speed too high Blade feed speed not constant	Increase the pitch (see p.35) (see p.34) (see p.34) (see p.34) (see p.34) Correct
<b>Blade breakage</b>	Incorrect ratio between feed and cutting speeds Incorrect clamping of saw blade Incorrect clamping of the work piece Tooth pitch too large or too small Lubrication/cooling absent or inadequate	(see p.34) Check flange Check clamping system Check pitch (see p.35) Check the equipment
<b>Poor surface finish of cut piece</b>	Worn teeth Tooth pitch too coarse Incorrect type of tooth Incorrect cutting speed	Regrind the saw Reduce the pitch (see p.35) (see p.34) (see p.34)

# Wolferal Premium Quality Cutting-Off Saw Blades

## TECHNICAL CHARACTERISTICS AND TOLERANCES

The WOLFERAL range includes three basic types of saw blades: STANDARD, PREMIUM and SUPREME.

'STANDARD' is normally used for traditional type cutting on slow cutting-off machines with levels of precision that ensure even closer tolerances than those called for by UNI 4012.

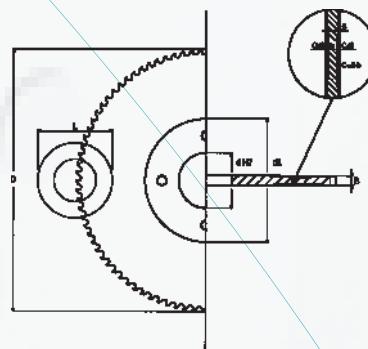

The grades of steel used are identical to those used for our PREMIUM and SUPREME types.

'PREMIUM' The premium saw blade is ideal where finer machining and greater cutting precision is required. The tolerances quoted for side run-out and flatness are reduced, giving better cutting results and unquestionable benefits in terms of reduced friction. The performance of the blades can be further enhanced when treated with a PVD surface coating.

'SUPREME' The supreme class achieves the maximum possible precision with a cutting tool; it is only recommended for use on fully automatic sawing machines which demand extremely close machining tolerances. The performance of the saw blades can be further enhanced if treated with a PVD surface coating.

The drawing opposite illustrates the main dimensions of a circular saw blade.

D = Diameter  
B = Width  
d = bore  
dl = Boss  
C = Taper  
L = Maximum cross section

The table below shows the main characteristics and tolerances for popular sizes of STANDARD, PREMIUM and SUPREME qualities.

D	B	d	dl	L Maximum recommended cross section	C	STANDARD	PREMIUM	SUPREME				
Diameter	Width	Hole	Hub		Taper	Max. conc.	Max. run out	Max. flatness	Max. run out	Max. flatness	Max. run out	Max. flatness

# Wolferal Premium Quality Cutting-Off Saw Blades

## SURFACE COATINGS

Wolferal are equipped with their own latest PVD coating plant supplied by Platin of Switzerland. The Platin PVD process is a new type of arc source which has been developed to overcome the limitations of traditional PVD arc technologies. This process is carried out at temperatures lower than those of tempering temperature of HSS ( $< 500^{\circ}\text{C}$ ).

They achieve coating deposits with significantly reduced internal tensions in the saw blade and allow for higher thickness of deposit (between 3 and 5 microns).

### These coatings result in:

- Increased surface hardness • Reduced friction • Reduced heat induction • Reduced formation of "pick up" • The possibility of dry cutting •
- Big improvements in productivity • Great reductions in manufacturing costs • Huge savings in the cost per cut.

### TiN Titanium Nitride

#### Technical characteristics:

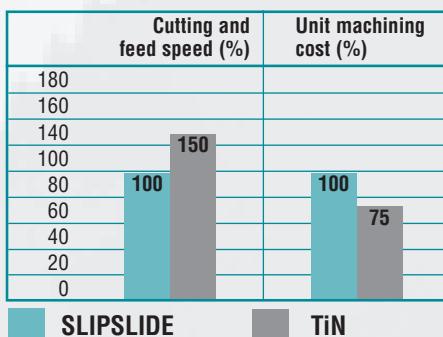

PVD coating  
Surface hardness: 2200-2400 HV  
Oxidation temperature:  $520^{\circ}\text{C}$   
Coefficient of friction : 0.55

#### Applications:

Medium hard steel  
Hard steels  
Furniture tube and sections in general  
Mixed, steel-plastic components

TiN

### COATING BAND WIDTHS

Blade Diameter mm	Boss Diameter mm	Coated band width mm
225	90	37
250	100	40
275	100	52
300	100	50
315	100	57
325	100	62
350	120	60
370	120	70
400	120	70
425	120	73
450	130	85
500	130	95
525	130	88
550	150	100
570	150	110
600	150	115

Our blades are coated to the minimum thickness point, usually two thirds of the way down the hollow ground section, thus ensuring that you can achieve the maximum depth of cut possible. It also gives you a greater number of regrinds.

### TiCN Titanium Carbo Nitride

This is a multi-layer coating with a very low coefficient of friction that allows cutting with an excellent finish, avoiding "pickup" on the edge of the blade teeth, even at very high cutting speeds and feed, both on very hard steels and when cutting copper and brass alloys or extremely abrasive materials, where the phenomenon of "pickup" is particularly frequent. The great surface hardness makes it possible to work at cutting speeds 100% higher than with normal blades and also increases the number of cuts between grinding operations.

#### Technical characteristics:

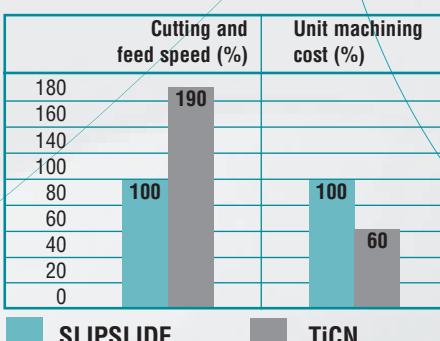

PVD coating  
Surface hardness: 3000-3300 HV  
Oxidation temperature:  $450^{\circ}\text{C}$   
Coefficient of friction : 0.35

#### Applications:

Very hard steels - Tempered steels  
Stainless steel - Titanium Aviations Alloys

TiCN

### TiAIN Titanium Aluminium Nitride

### TiAIN Titanium Aluminium Nitride

Suitable for cutting materials with very high tensile strength and stainless steels; also recommended for cutting abrasive materials such as cast iron, silicon aluminium alloy, brass and copper. Particularly suited to meeting the needs of dry cutting at relatively high cutting speeds, due to its low coefficient of friction. The high temperatures it can withstand, due to its low thermal conductivity, should also be emphasised.

#### Technical characteristics:

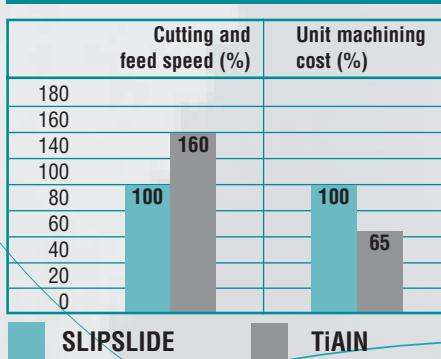

PVD coating  
Surface hardness: 3300-3500 HV  
Oxidation temperature:  $875^{\circ}\text{C}$   
Coefficient of friction : 0.45

#### Applications:

Hard steels - Stainless steels - Cast iron  
High cutting speeds

TiAIN

### COATING SUGGESTIONS

#### MATERIAL TO BE CUT

- Mild Steels 500 – 750 N/mm<sup>2</sup>
- Hard Steels 800 – 1000 N/mm<sup>2</sup>
- Very hard Steels over 1000 N/mm<sup>2</sup>
- Stainless Steels
- Inconel
- Titanium
- Nickel Alloys

# Wolferal Premium Quality Cutting-Off Saw Blades

## TOOTHING

The technical drawing below shows the correct tooth geometry and main characteristics of the three most commonly used toothforms on Wolferal cutting-off blades: Toothforms (BW, C and BS).

Symbol	Description
T	Tooth pitch
p	Tooth height
h	Difference HZ
$\gamma$	Cutting angle
$\alpha$	Clearance angle
f	Clearance length
B	Blade thickness
d	Gullet diameter

**Table A** shows the relationship between the pitch, height and diameter of the gullet space.

T	3	4	5	6	7	8	9	10	12	14	16
p	1,3	1,6	2,1	2,5	2,9	3,4	3,8	4,2	5,1	5,9	7,2
d	1,5	2	2,5	3	3,5	4	4,5	5	6	7	8

**h=0.2 mm**

**h=0.3 mm**

**Table B** shows the recommended cutting angle and clearance angle values for the most commonly used materials.

Materials	$\gamma$ Cutting Angle	$\alpha$ Clearance Angle
Steel 350-900 N/mm <sup>2</sup>	18°	12°
Steel 900-1200 N/mm <sup>2</sup>	12°	6°
Stainless steel	12°	6°
Cast iron	12°	8°
Aluminium and its alloys	16°-22°	10°-18°
Copper	16°-20°	10°-18°
Bronze	12°	8°
Brass	15°	15°
Titanium	2°	15°

Premium Wolferal saws are supplied with the following universal standard angle: Cutting angle  $\gamma = 18^\circ$ , clearance angle  $\alpha = 12^\circ$ . These are an excellent compromise for the most common applications. For further detailed information please contact our engineering department.

## CUTTING SPEEDS AND FEED RATES

It is essential that the rotation speed and feed speed (when automatic machines are involved) should be under control in order to optimise the cutting process. There is in fact a close relationship between the two speeds (rotation and feed) which must always be observed. For example, if the blade speed is too high in relation to the speed of the speed of engagement, there is more of a "rubbing" effect than a cutting action; the blade overheats and tends to wear without performing well.

If, on the other hand, the lowering speed is too high in relation to the rotation speed, the blade does not have enough time to clear away the chip, which can cause the blade to break.

In the table below, obtained from experimental data, we recommend the most suitable Cutting speed (V) and Feed/tooth (Az) values, according to the material to be cut.

Materials	(V) Cutting Speed (m/min)	(Az) Feed/Tooth (mm)
C10, C15, St34, St37, steels up to 500 N/mm <sup>2</sup>	30 - 50	0,03 - 0,06
C20, C40, 15Cr3, 16MnCr5, steels up to 800 N/mm <sup>2</sup>	20 - 40	0,03 - 0,04
38NCD4, 50CrV4, 14NiCr14, steels up to 1200 N/mm <sup>2</sup>	15 - 25	0,02 - 0,03
Stainless steel	10 - 30	0,01 - 0,03
Cast iron	30 - 50	0,04 - 0,05
Aluminium (solid bar) and alloys	600 - 900	0,04 - 0,09
Aluminium (section) and alloys	800 - 1200	0,03 - 0,07
Bronze and Copper	200 - 300	0,04 - 0,06
Brass	400 - 600	0,04 - 0,08
Synthetic materials	60 - 150	0,04 - 0,08

# Wolferal Premium Quality Cutting-Off Saw Blades

## GUIDE TO TOOTH PITCH SELECTION AND CUTTING SPEEDS AND FEEDS

Many factors influence the choice of the right saw blades for a particular job, especially so on modern day automatic sawing machines such as Adige, Bewo, Sinico, Wagner and others where the cycle times and type of PVD coating and CBN chipbreaker toothing have such an important influence on the cutting rates and overall performance. In these cases we would be only too pleased to discuss your requirements and give you the benefits of over 50 years experience.

In general though our experience shows that the optimum cutting speed and feed has in most instances already been determined by the user to suit his local conditions.

However, where recommendations are required, we suggest the following factors are taken into account:

- 1. Material to be cut
- 2. Type and cross section of material to be cut
- 3. Type of lubrication
- 4. Tooth geometry
- 5. Toothform
- 6. Type of coating on saw blade

Following on from this, we suggest as a basis, the tooth pitches, feeds and speeds given below.

	Mild steel	Medium steel	Hard steel	Stainless steel	Cast iron	Aluminium	Bronze-Copper	Brass
Tube/Section (mm)	Pitch T (mm)							
<1	3	3	3	3	-	4	4	4
1-1,5	4	4	3	4	-	5	5	5
1,5 - 2	5	4	4	5	-	6	6	6
2-3	5	5	5	5	-	7	7	7
>3	6	6	5	6	-	8	8	8
Solid Section (mm)	Pitch T (mm)							
10-20	5	5	5	5	5	6	6	8
20-40	8	6	6	6	6	8	8	10
40-60	10	10	8	8	8	12	10	12
60-90	12	12	10	11	11	16	13	14
90-110	14	14	12	14	14	18	15	17
110-130	16	16	14	16	16	20	17	19
130-150	18	16	14	16	16	20	19	20
Pitch T (mm)	Feed Speed A (mm/min)							
3	350-450	250-350	90-160	70-150	350-550	-	-	-

Prices subject to generous quantity and resale discounts.

# Wolferal Cutting Performance and Life of the Tool

The most common reason for the failure of any circular saw blade is the lack of compatibility between the peripheral cutting speed applied to the blade and the nature of the material being cut.

Our experience shows that the optimum cutting speed and feed has in most instances already been determined by the user to suit his local conditions.

**HOWEVER, WHERE RECOMMENDATIONS ARE REQUIRED WE SUGGEST AS A BASIS THE FOLLOWING CUTTING SPEEDS:**

Material to be machined	Tensile Strength N/mm <sup>2</sup> or Hardness Brinell HB	M2 High Speed Steel		Solid Carbide	
		Cutting Speed metres/min.	Feed per Tooth mm	Cutting Speed metres/min.	Feed per Tooth mm
Free cutting steel	350 - 500 N/mm <sup>2</sup>	10 - 45	0.02 - 0.04	80 - 180	0.01 - 0.02
General structural steel	500 - 750 N/mm <sup>2</sup>	15 - 50	0.02 - 0.03	90 - 200	0.005 - 0.02
Case hardening steel	500 - 800 N/mm <sup>2</sup>	20 - 50	0.02 - 0.03	100 - 200	0.005 - 0.02
Stainless steel, cast steel	450 - 950 N/mm <sup>2</sup>	10 - 20	0.01 - 0.02	60 - 180	0.01 - 0.02
Nitriding steel	700 - 1250 N/mm <sup>2</sup>	5 - 20	0.005 - 0.02	20 - 120	0.005 - 0.02
Cast steel	400 - 1120 N/mm <sup>2</sup>	10 - 15	0.01 - 0.02	30 - 150	0.005 - 0.02
Heat treated steel - annealed	500 - 750 N/mm <sup>2</sup>	15 - 30	0.02 - 0.03	80 - 180	0.005 - 0.02
- tempered, unalloyed	700 - 1000 N/mm <sup>2</sup>	10 - 20	0.01 - 0.02	30 - 130	0.003 - 0.01
- tempered, alloyed	700 - 1250 N/mm <sup>2</sup>	5 - 20	0.005 - 0.02	20 - 120	0.003 - 0.01
Tool steel	- alloyed, tempered	5 - 15	0.005 - 0.02	20 - 60	0.002 - 0.005
- unalloyed or alloyed					
soft annealed	HB 180 - 240	40 - 50	0.02 - 0.04	160 - 200	0.01 - 0.02
- carburised and/or					
highly alloyed, soft annealed	HB 220 - 300	40 - 45	0.02 - 0.04	160 - 180	0.01 - 0.02
Cast iron - nodular - globular	HB 100 - 320	15 - 35	0.02 - 0.05	40 - 90	0.005 - 0.02
Malleable cast iron	HB 100 - 270	15 - 45	0.02 - 0.05	40 - 100	0.005 - 0.02
Aluminium alloys	up to 250 N/mm <sup>2</sup>	120 - 1000	0.02 - 0.10	400 - 2000	0.005 - 0.1
Copper	200 - 400 N/mm <sup>2</sup>	100 - 400	0.02 - 0.08	200 - 500	0.01 - 0.03
Copper alloys	200 - 500 N/mm <sup>2</sup>	100 - 300	0.02 - 0.08	200 - 500	0.01 - 0.03
Magnesium alloys	150 - 300 N/mm <sup>2</sup>	200 - 300	0.02 - 0.05	500 - 800	0.01 - 0.03
Titanium	600 - 1100 N/mm <sup>2</sup>	15 - 50	0.01 - 0.03	60 - 100	0.005 - 0.02
Plastics - Thermo plastic non laminated	Plexiglass etc.	≤ 3000	0.01 - 0.03	≤ 5000	0.01 - 0.10
- Thermo setting plastics	Organic	≤ 3000	0.01 - 0.03	≤ 2000	0.01 - 0.10
- Laminates	Inorganic				

## USE LOWER SPEED RANGES FOR:

- Rough cast and abrasive materials - Tough and harder alloys.
- Heavy, deep and large cross section cuts - Where excessive wear of saw teeth is occurring.

## USE HIGHER SPEED RANGES FOR:

- Free cutting alloys - Softer alloys - Better finishes - Small diameter saws.
- Profiles, thin walled sections - Where excessive chipping of saw teeth is occurring.

## FEED

In most cases local conditions are the determining factor. Generally speaking the feed is increased for soft material and large cross section cuts and reduced for hard material. Experience shows that when trying to improve performance, users normally increase the speed. However, in many instances it is better to reduce the latter and to increase the feed. This ensures higher performance (shorter cycle time) and longer life.

## CORRECT CUTTING LUBRICANTS

Optimal performance and tool life cannot be achieved without sufficient cooling and lubricating. As a general rule once you have selected the cutting oil, you should increase the speed and feed until the lubricant starts to emit a slight vapour (smoke).

## USEFUL FORMULAE

**Cutting Speed: v [ m / min ]**

$$v = \frac{D \cdot \pi \cdot n}{1000}$$

D = Saw dia (mm)

π = Constant 3.14

N = rpm [1/min]

**Feed: S [ mm / min ]**

$$S = S_z \cdot Z \cdot n$$

Sz = Feed per tooth (mm/tooth)

Z = Number of teeth

n = rpm [1/min]

**rpm : n [ 1 / min ]**

$$n = \frac{v \cdot 1000}{D \cdot \pi}$$

v = Cutting speed (M/min)

D = Saw dia (mm)

π = Constant 3.14

**Feed per tooth: Sz [ mm/tooth ]**

$$S_z = \frac{S}{Z \cdot n}$$

S = Feed (mm/min)

Z = Number of teeth

n = rpm [1/min]

# Wolferal HSS Metal Slitting Saws

To BS 122, Part 1, 1953.

Stocked as standard with coarse teeth.

Used for medium deep cutting and cut-off operations. Hollow ground on both sides to prevent binding.

**Saw Arbor 5/8-1" – E260 – £60.00**

## Super Wolferal Heavy-Duty Saw Blades

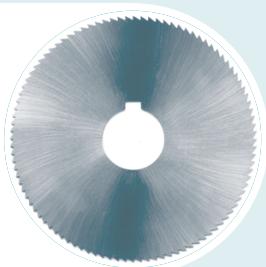

For use on pipe-cutting machines such as George Fischer, Axxair and others.

EMo5Co5 Cobalt bearing steel can be used on all pipes and tubes but especially recommended for chrome alloy and stainless steel pipes and tubes. DM05 SHSS recommended for cutting all pipes and tubes except those made out of chrome alloy steels and stainless steels.

# Wolferal HSS Metal Slitting Saws

To BS 122, Part 1, 1953.

Stocked as standard with fine pitch ( $\frac{1}{8}$ "').

Used for shallow cutting and cut-off operations. Hollow ground on both sides to prevent binding.

\* \* \* SPECIAL SAWS ON REQUEST \* \* \*

# Wolferal HSS Slitting Saws, Metric

With Coarse Pitch as to DIN 1838 Toothform B DIN 1840.  
Stock Sizes.

Dimensions in millimetres. Used for medium deep cutting and cut-off operations.  
Hollow ground on both sides to prevent binding.

## MIXED INCH/METRIC DIMENSIONS

WE CAN SUPPLY ANY CUTTING TOOL TO MIXED DIMENSIONS. WE OPERATE A 7-DAY COMPLETE MODIFICATION SERVICE.

We offer a complete service for all tools and saw blades of the types we sell.

**WE DO OUR BEST TO GIVE YOU SAME DAY DELIVERY SERVICE AND OPERATE A "DIRECT TO USER" DELIVERY SERVICE WHICH SAVES YOU TIME, PACKING AND POSTAGE.**

**PLEASE ASK FOR DETAILS.**

# Wolferal Commutator/Undercutting Saws

## GENERAL

Wolferal Undercutting Saws and V-Cutters are available in High-Speed Steel or Tungsten Carbide. Both types are carefully designed as to tooth form, hollow grind, hardness etc., and are manufactured to close tolerances.

While used primarily for undercutting mica and slotting risers of commutators, Wolferal Undercutting Saws and V-Cutters are also used for cutting steel, aluminium, plastics and other materials not requiring set teeth.

Undercutting differs from ordinary machining in that, instead of shearing, it is a combination of crushing, grinding and conveying. Mica is very abrasive and varies in hardness, making necessary the very best design and production controls in the manufacture of undercutting saws.

## HIGH SPEED STEEL SAWs AND V-CUTTERS

These may be used on either portable or stationary equipment with spindle speeds of 1,500 to 5,000 r.p.m.

## HIGH-SPEED STEEL AND SOLID CARBIDE

# Wolferal Solid Carbide Saws, Metric

Precision ground all over, highly polished finish.

Stocked with toothforms A (fine) and B (coarse) to DIN 1840.

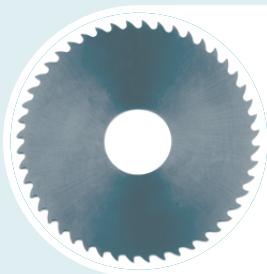

Dimensions in millimetres to DIN 1837 and 1838. Used for longer life, less down-time and better quality finishes. Also available with toothforms AW, BW and C to DIN 1840.

# Wolferal M2 HSS Side Chip Clearance Saws

## Staggered Tooth Type A. Imperial Range.

### Stock Sizes.

Staggered teeth are especially recommended for deep-slotted and heavy-duty cutting. The alternate helical teeth give a shearing action without chatter.

## Wolferal HSS Concave Milling Cutters

### To DIN 855A. METRIC.

**Application** – Convex and Concave Cutters have top relief only and will maintain their form throughout their life, provided that on resharpening, the face of the tooth is ground Radial-to-Centre.

## RIGHT HAND

## LEFT HAND

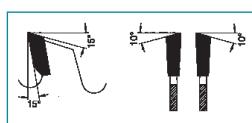

# Wolferal T.C.T. Saw Blades

The Wolferal range of T.C.T. saw blades is made to be used on the most demanding industrial applications.

The blades are laser-cut from high quality chrome vanadium plate which is then hardened and tempered, straightened and tensioned.

The tips are made from the finest quality micro-grain carbides, the grades of which are selected to be the best for different applications, with the size of tip chosen to give the maximum number of regrinds.

## TYPE: HARPOON

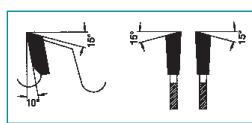

**For normal ripping applications.** An economical ripsaw for hard/soft woods.

*Finish: COARSE*

## TYPE: ALEX

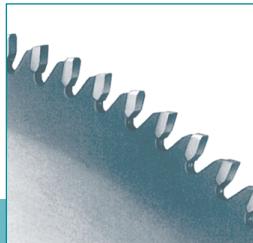

**For cutting uPVC and aluminium extrusions.** Fast, clean cutting blades used extensively in the window fabricating industry on uPVC and aluminium. Supplied with a negative hook angle. They can also be used on some DeWalt and Elu snip-off mitre saws. On Aluminium can reduce noise up to 50%.

Finish: FINE

## STEEL CUTTING

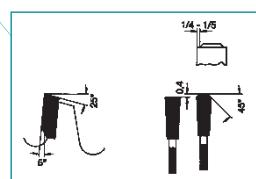

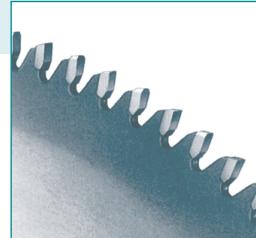

**Fast, dry-cutting saw blades.** The bigger blades are used on dry-cutting machines made by Jepson, Rigid and Draper. They give clean, burr-free cuts in steel, copper and aluminium, pipes, flats, angles, small solids, sheets and cable. The teeth and the back of the teeth and the saw body are designed to withstand heavy cutting forces whilst cutting different kinds of material. Toothform ATB, chamfered, special universal geometry.

*Finish: BURR-FREE*

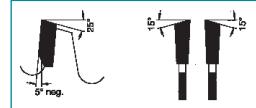

**For use on dry-cutting machines such as Draper, Jepson etc.**

## Throw-Away Carbide-Tipped Saw Blades for cutting steel.

The latest cutting technology, giving outstanding quality-of-cut surface. The tables below give the most common cutting-off machines.

These blades are used to cut solid bar made out of mild steels, hard steels and stainless steels. They can also be TiN, TiCN or TiAlN coated.

**250mm dia.** For use on the following machines: ADIGE TP103, BEHRINGER-EISELE HCS-90, EXACT-CUT MAC 60, NISHIJIMA 050N, RHOBITSUNE TK5C-50GL and WAGNER-KASTO WAC70.

## CUTTING PARAMETERS FOR SOLID MATERIAL

Material	Cutting Speed (m/min)	Feed per tooth (mm)
Mild Steel 400-800 N/mm <sup>2</sup>	100 - 140	0.07 - 0.10
Hard Steel 900-1300 N/mm <sup>2</sup>	70 - 110	0.05 - 0.07
Stainless Steel	60 - 90	0.05 - 0.07

# Wolferal Friction Saws

Made of high quality special steels, hardened in accordance with latest technical findings.

They have milled special teeth and are hollow ground on both sides in modern precision grinding machines. All Wolferal blades are piece-by-piece examined for hardness, side run-out and concentricity. They can be mounted on all high-speed machines at recommended peripheral cutting speeds of 80-125 m/s. The ideal speed for cutting iron and steel is 125 m/s. For aluminium and other non-ferrous metals, special designs are available.

## C.V.A. QUALITY

Recommended for casual and intermittent cutting.

Recommended for blades over 700mm diameter.

## 70WM QUALITY

Recommended for continuous production.

Especially recommended for use on flying saws in tubing and profile mills.

### Some efficiency examples:

Minimum cutting speed 80 m/sec.

Motor of at least 5 hp, Blade 520 mm Ø x 3 mm.

L-shape iron bars (angle iron) up to 80 x 80 x 8mm.

Tubes up to 80 Ø x 4mm thickness.

Normal sections (profiles) up to 16mm build. height.

Solid material up to 20mm Ø.

Sheets up to 6mm thickness.

Recommended blade thickness: 4mm.

Motor of 12 to 15 hp, blade 560mm Ø x 4mm.

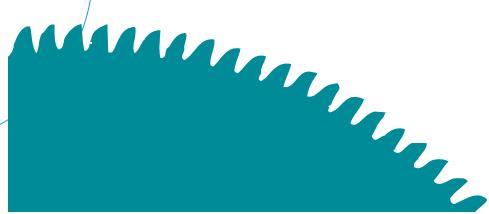

L-shape iron bars (angle iron) up to 150 x 150 x 12mm.

Tubes up to 150mm Ø.

Solid material up to 40mm Ø.

Normal sections up to 32mm build height.

Sheets up to 15mm thickness.

## HOT SAW BLADES

up to 2000mm diameter

of tried and proven special alloy steels of various strengths:

- natural hardness up to 1100 N/mm<sup>2</sup>
- tempered up to RC 48
- black rolled
- taper ground
- conically ground
- hollow ground

straightened and tensioned with milled teeth.

Examples of tooth styles:

PENDULUM TOOTH STYLE

CASTELLATED TOOTH STYLE

We supply a full range of thicknesses and are always pleased to offer advice on specific applications.

# Wolferal Segmental Saws

**Designed to meet the requirements of present-day high speed cold saws.**

The segments are made from specially-treated high speed steel and form a closed ring around the saw plate. The saw plates are hardened and tempered to maintain accuracy throughout the working life of the saw.

**Segment Life.** The Wolferal segment has maximum usable height, allowing for more regrinds and longer life.

We also supply Carbide Tipped circular saw blades for steel and non-ferrous metals up to 2000mm diameter.

# **Wolferal Xtra-Wax** CHLORINE-FREE

## **FOR ALL MACHINING OPERATIONS**

### **EASY IN APPLICATION AND MOST EFFECTIVE IN PERFORMANCE**

#### **XTRA-WAX Stick Lubricant**

Apply this useful stick lubricant directly to the cutting tool. Prevents binding, greatly extends tool life and provides a much cleaner and smoother cut.

#### **XTRA-WAX**

is especially effective at lubricating and cooling HSS circular saws, T.C.T. circular saws, band saws, router cutters, drills, end mills, taps etc., wherever non-circulating lubricant is required. No solvent waste.

#### **XTRA-WAX**

works on ferrous metals, non-ferrous metals and plastic. Does not stain aluminium. On copper gives supreme results.

#### **XTRA-WAX**

is safe, cost effective and clean. The tubular dispenser permits safe application. Adhering to the cutting edges it requires only occasional use. XTRA-WAX does not splash or spill. It does not pollute the air as with a mist coolant.

#### **XTRA-WAX**

helps to achieve optimum performance in manual tapping and screwing operations, in drilling and tapping blind holes and finish boring fine orifices.

**Used throughout Europe, a very high quality low melting point solid lubricant. Supplied in a handy push-up dispenser. Wolferal Xtra-Wax is available, mainly for circular saws: in sticks 55mm dia. approx. 350 gr weight.**

#### **DIN SAFETY FORMULA WOLFERAL XTRA-WAX**

Mineral oil, high molecular hydrocarbon, grease, sulphur compounds.

- 2.1 SOFTENING TEMPERATURE 88°C.
- 2.5 NOT SOLUBLE IN WATER.
- 2.7 FLASH POINT 270°C.
- 2.10 THERMAL DECOMPOSITION ABOVE 150°C.
- 2.11 DANGEROUS DECOMPOSITION PRODUCTS: H<sub>2</sub>S DEVELOPMENT (SEE 2.13).
- 2.12 DANGEROUS REACTIONS: NONE
- 2.13 NO DECOMPOSITION IN NORMAL HANDLING AND STORAGE.
3. NO SPECIAL TRANSPORT INSTRUCTIONS.
4. THE PRODUCT DOES NOT CONTAIN ANY CHLORE COMPOUNDS.  
THE PRODUCT DOES NOT REQUIRE SPECIAL MARKING.
- 5.3 CONTINUOUS HAND CONTACT SHOULD BE AVOIDED UNLESS USUAL HYGIENE MEASURES, SUCH AS WHEN DEALING WITH ANY OIL PRODUCT, ARE OBSERVED.
7. AFTER MANY YEARS OF USAGE NO HARMFUL OCCURRENCE HAS BEEN NOTED IN TOXICITY.

# Wolferal Diamond Blades

## WOLFERAL DIAMOND – FE

Sintered Diamond blade for cutting concrete, reinforced concrete, granite, natural stone, bricks, roof tiles and tiles. High cutting speed and long life, 8mm segments. Continuous segments on the steel core offers extra stability. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
107 x 2.2 x 8	Metallic Green	20.0/22.2	FE4
115 x 2.2 x 8	Metallic Green	22.2	FE4.5
125 x 2.2 x 8	Metallic Green	22.2	FE5
150 x 2.4 x 8	Metallic Green	22.2	FE6
180 x 2.4 x 8	Metallic Green	22.2	FE7
230 x 2.6 x 8	Metallic Green	22.2/70.0	FE9
305 x 2.9 x 8	Metallic Green	20.0/22.2/25.4	FE12

## WOLFERAL DIAMOND – SC

Sintered Diamond blade for cutting marble, tiles, ceramic tiles. Good cutting speed and precise finish. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
80 x 1.4 x 5	Metallic Green	15.0/22.2	SC3
110 x 1.4 x 5	Metallic Green	22.2	SC4.5
125 x 1.4 x 5	Metallic Green	22.2	SC5
150 x 1.4 x 5	Metallic Green	22.2	SC6
180 x 1.6 x 5	Metallic Green	22.2/30.0	SC7
204 x 1.6 x 5	Metallic Green	22.2/25.4/30.0	SC8
230 x 2.0 x 5	Metallic Green	22.2/25.4/30.0	SC9
250 x 2 x 5	Metallic Green	25.4/30.0	SC10
305 x 2.0 x 5	Metallic Green	20.0/25.4/30.0	SC12

## WOLFERAL DIAMOND – RI

Sintered Diamond blade for cutting granite and natural stone. Premium quality, fast cutting, quality finish. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
115 x 2.0 x 6	Black	22.2	RI4.5
125 x 2.0 x 6	Black	22.2	RI5
175 x 2.2 x 6	Black	22.2	RI7
203 x 2.2 x 6	Black	22.2	RI8
230 x 2.4 x 6	Black	22.2/70.0	RI9

## WOLFERAL DIAMOND – SEKR

Sintered Diamond blade for cutting concrete, reinforced concrete, bricks and roof tiles. Fast cutting and a long life. High diamond concentration. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
115 x 1.8 x 6	White	22.2	SEKR4.5
125 x 2.0 x 6	White	22.2	SEKR5
150 x 2.0 x 6	White	22.2	SEKR6
175 x 2.0 x 6	White	22.2	SEKR7
230 x 2.2 x 6	White	22.2	SEKR9

# Wolferal Diamond Blades

*– Continued*

Laser Welded Diamond Blades for all types of concrete (with the exception of green concrete) and bricks. High cutting speed and long life. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
115 x 2.2 x 7	Clear Gold	22.2	LW4.5
125 x 2.2 x 7	Clear Gold	22.2	LW5
150 x 2.5 x 7	Clear Gold	22.2	LW6
175 x 2.2 x 7	Clear Gold	22.2	LW7
230 x 2.2 x 7	Clear Gold	22.2	LW9

Laser Welded Diamond Blades, super premium, for very hard compressed concrete, reinforced concrete and bricks. Due to its unique shape and quality of diamond and bond, it is the market-leading concrete cutting blade. Excellent performance on petrol saw machines. Segment height 11mm. Dry use.

Dimensions	Standard Colour	Arborholes	Order Code
308 x 3.0 x 11	Metallic Green	20.0/22.2/25.4	LWGH12
358 x 3.2 x 11	Metallic Green	20.0/25.4	LWGH14

Sintered Diamond Blades for cutting tiles and marble. Excellent cutting speed and long life. Wet use.

Dimensions	Standard Colour	Arborholes	Order Code
110 x 1.4 x 5	Hi Clear	20.0/22.2	SMT4.5
125 x 1.4 x 5	Hi Clear	22.2	SMT5
150 x 1.4 x 6	Hi Clear	22.2	SMT6
180 x 1.6 x 5	Hi Clear	22.2/25.4	SMT7
201 x 1.6 x 5	Hi Clear	22.2/25.4	SMT8
230 x 1.6 x 5	Hi Clear	25.4/30.0	SMT9
250 x 1.6 x 5	Hi Clear	25.4/30.0	SMT10
305 x 2.0 x 5	Hi Clear	20.0/25.4/30.0	SMT12
355 x 2.0 x 5	Hi Clear	25.4	SMT14

Tuck Point premium quality blade for mortar raking. For removal of joints. Excellent performance.

Dimensions	Standard Colour	Arborholes	Order Code
115 x 6.0 x 6	Hi Clear	22.2	TP4.5
125 x 6.0 x 6	Hi Clear	22.2	TP5

# Premium Wolferal HSS-E Single Flute Router Cutters

## TOOLING FOR WINDOW FABRICATORS

Precision ground all over, hardened and tempered to perfection to give longest possible tool life and lowest machining cost when drilling, slotting or cutting aluminium, anodised duralium and uPVC. HSS-E EM05V3 is a special heavy-duty cobalt-bearing steel.

### PLUNGE SLOTTING/ROUTING

⚠ 10,000 - 12,000 rpm

**One Flute Helical** for drilling, slotting and cutting aluminium, anodised duralium and uPVC. Ideal for recessing and slotting extrusions.

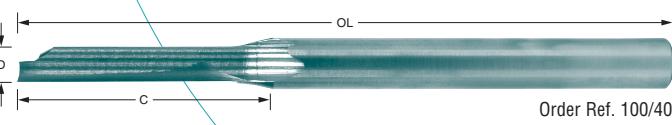

**One Flute Helical** with narrow neck for deep entry into second web of extrusions.

### WATER SLOT CUTTER – STRAIGHT

⚠ 10,000 - 12,000 rpm

**One Flute Straight** for plastics only.

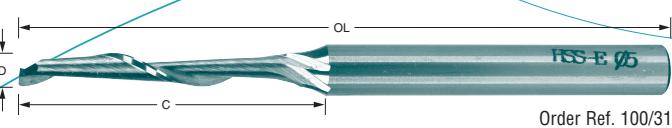

Order Ref. 100/40

### WATER SLOT CUTTERS

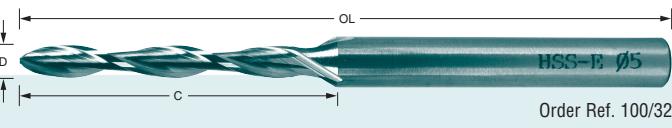

⚠ 10,000 - 12,000 rpm

**One Flute Helical** with normal neck but long shank and cutting length.

Order Ref. 100/31

**Two Flute Helical** for plastic with long shank.

Order Ref. 100/32

When cutting aluminium, use a lubricant or XTRA-WAX wax stick (see page 45) and ensure section is securely clamped.
